Phase 1 – Platform Foundation & Data Model

AHIP – AI Healthcare Intelligence Platform

Real Rails Agentic AI Internship Project | Phase Execution Pack

Objective: Create the AHIP base application foundation and healthcare data model.

1. What AHIP Is

AHIP is an Agentic Healthcare Operations Intelligence Platform. It uses specialized agents, agent memory, context engineering, multi-agent collaboration and decision intelligence to identify healthcare workflow gaps and recommend operational actions.

AHIP is not a chatbot, not a generic RAG app and not a medical diagnosis tool.

2. What Was Built Previously

Phase 0 established the domain, agent opportunities and MVP assumptions. Now convert that understanding into the first technical foundation.

3. What To Learn In This Phase

Healthcare Learning

How patients, providers, claims, benefit plans, contracts and workflow events relate to each other.

Agentic AI Learning

How agents depend on clean data, structured context and auditable workflow events.

4. What We Build In This Phase

Application shell, backend foundation, database model, seed data, basic UI pages and API endpoints.

5. Required Feeder Documents

- AHIP Product Bible
- AHIP Healthcare Domain Guide
- AHIP Agentic AI Guide
- AHIP Architecture Guide
- AHIP Execution Protocol
- Current Phase HTML
- Latest Repomix generated from the current repository
- Any phase-specific healthcare notes, sample data, screenshots or business rules

6. Mandatory Additional Input Question

Before starting implementation, the intern must ask:

Do we have any additional documents, workflows, screenshots, sample data, business rules, healthcare examples or phase-specific inputs that should be added before implementing this phase?

If no additional input is provided, proceed using the AHIP assumptions and clearly list those assumptions.

7. Repomix Instruction

1. Generate latest Repomix from the current AHIP repository.
2. Attach or paste it with the phase prompt.
3. Ask AI to first analyze current code state.
4. Do not ask AI to blindly rewrite the project.
5. Apply changes in small validated steps.

8. AI Prompt Framework

Act as an Enterprise Healthcare Product Architect, Agentic AI Architect and Real Rails Internship Mentor.
We are building AHIP – AI Healthcare Intelligence Platform.
This is Phase 1: Platform Foundation & Data Model.

This is not a chatbot.
This is not a generic RAG system.
This is a healthcare workflow intelligence platform.

Use:

- AHIP Product Bible
- AHIP Healthcare Domain Guide
- AHIP Agentic AI Guide
- AHIP Architecture Guide
- AHIP Execution Protocol
- Current Phase HTML
- Latest Repomix

First provide:

1. What already exists
2. What this phase must add
3. Healthcare concepts involved
4. Agentic AI concepts involved
5. Files/modules likely affected
6. Step-by-step implementation plan
7. Validation checklist
8. Risks and assumptions

Do not start coding until the plan is clear.

9. Deliverables

- Backend/API foundation
- Healthcare database schema
- Seed dataset
- Basic frontend dashboard shell
- Entity list/detail screens
- README update

10. Validation Checklist

- App runs locally
- Seed data loads
- API returns healthcare records
- Basic UI can show records
- Data model supports future agents

11. GitHub Completion Template

Phase 1 – Platform Foundation & Data Model – Completed 

Completed:

- [Add completed item]
- [Add completed item]
- [Add completed item]

Healthcare Concepts Covered:

- [Add healthcare concepts]

Agentic AI Concepts Covered:

- [Add AI concepts]

Validation:

- [Add validation performed]
- [Add screenshots/logs if applicable]

AI Usage:

- Used AI for planning / debugging / documentation
- Outputs manually reviewed

Known Limitations:

- [Add limitation]

Next Phase Readiness:

- Ready / Not Ready
- Notes:

12. Handover Checklist

- Code or research output committed.
- README or phase note updated.
- Validation evidence captured.
- Known limitations listed.
- Next phase dependencies documented.
- GitHub completion post added.

13. Do Not

- Do not convert AHIP into a chatbot.
- Do not build only document Q&A.
- Do not invent unsupported healthcare rules.
- Do not make medical diagnosis or treatment recommendations.
- Do not skip auditability.

Prepared for Real Rails Agentic AI Internship Program – AHIP Phase Execution Pack.

Collaborator

Phase 1 – Platform Foundation & Data Model – Completed

Completed

- Set up FastAPI backend foundation with clean architecture structure.
- Configured PostgreSQL database integration using SQLAlchemy ORM.
- Implemented healthcare entities:
 - Patient
 - Claim
 - Provider
- Created database tables and loaded seed healthcare data.
- Implemented Patient APIs:
 - List Patients
 - Get Patient by Member ID
 - Create Patient
- Implemented Claim APIs:
 - List Claims
 - Get Claim by Claim ID

- Create Claim
- Implemented Provider APIs:
 - List Providers
 - Get Provider by Provider ID
 - Create Provider
- Implemented Dashboard Summary API.
- Connected frontend dashboard with backend APIs.
- Displayed Patients, Claims and Providers on dashboard.
- Verified API functionality using Swagger UI.
- Updated README with Phase 1 implementation details.

Healthcare Concepts Covered

- Member / Patient
- Provider
- Healthcare Claims
- Claim Status
- Provider Network Status
- Healthcare Operational Metrics
- Healthcare Workflow Intelligence Foundation
- Entity Relationships for Future Agent Workflows

Agentic AI Concepts Covered

- Structured Healthcare Context
- Agent-ready Data Model
- Auditable Data Foundation
- Multi-Agent Workflow Preparation
- Decision Intelligence Foundation
- Context Layer Preparation
- Memory Layer Preparation

Validation

Application Validation

- Backend runs successfully using FastAPI.
- Frontend runs successfully using React + Vite.
- PostgreSQL database connected successfully.
- Seed data loaded successfully.

API Validation

- GET /patients working
- GET /patients/{member_id} working
- POST /patients working
- GET /claims working
- GET /claims/{claim_id} working
- POST /claims working
- GET /providers working
- GET /providers/{provider_id} working

- POST /providers working
- Dashboard summary endpoint working

UI Validation

- Dashboard loads successfully.
- Dashboard metrics displayed.
- Patient records displayed.
- Claim records displayed.
- Provider records displayed.
- Agent workflow section functional.

Evidence

Screenshots captured:

- dashboard.png
- swagger_overview.png
- patient_api.png
- claim_api.png
- provider_api.png

AI Usage

- Used AI for planning, debugging, implementation guidance and documentation.
- All generated outputs were manually reviewed and validated.

Known Limitations

- Benefit Plan entity not yet implemented.
- Provider Contract entity not yet implemented.
- Workflow Event entity not yet implemented.
- No authentication or authorization layer yet.
- Dashboard uses basic summary metrics.
- Agent outputs are currently sample implementations.

Next Phase Readiness

Ready 

Notes

Phase 1 established the healthcare platform foundation, healthcare data model, API layer, seed dataset, dashboard integration and agent-ready architecture required for future workflow intelligence capabilities.

Curl

```
curl -X 'GET' \
  'http://localhost:8000/api/v1/claims/' \
  -H 'accept: application/json'
```

Request URL

```
http://localhost:8000/api/v1/claims/
```

Server response

Code

Details
