Phase 3 – Knowledge Layer & Context Engineering

AHIP – AI Healthcare Intelligence Platform

Real Rails Agentic AI Internship Project | Phase Execution Pack

Objective: Build reusable healthcare context packs and relationship mapping.

1. What AHIP Is

AHIP is an Agentic Healthcare Operations Intelligence Platform. It uses specialized agents, agent memory, context engineering, multi-agent collaboration and decision intelligence to identify healthcare workflow gaps and recommend operational actions.

AHIP is not a chatbot, not a generic RAG app and not a medical diagnosis tool.

2. What Was Built Previously

Phase 2 agents work, but they may still reason on limited or isolated data. This phase improves intelligence by creating the right context for each agent.

3. What To Learn In This Phase

Healthcare Learning

Claim-to-provider relationship, benefit-plan mapping, contract effective dates, patient timeline and care-task dependencies.

Agentic AI Learning

Context engineering, context pack design, knowledge graph thinking, retrieval boundary and context minimization.

4. What We Build In This Phase

Context builder service, relationship model, agent-specific context packs, graph-style mapping view.

5. Required Feeder Documents

• AHIP Product Bible

• AHIP Healthcare Domain Guide

• AHIP Agentic AI Guide

• AHIP Architecture Guide

• AHIP Execution Protocol

• Current Phase HTML

• Latest Repomix generated from the current repository

• Any phase-specific healthcare notes, sample data, screenshots or business rules

6. Mandatory Additional Input Question

Before starting implementation, the intern must ask:

https://github.com/RealRails-AgenticAI/AHIP---AI-Healthcare-Intelligence/discussions/5

1/4

Do we have any additional documents, workflows, screenshots, sample data, business rules, healthcare examples or phase-specific inputs that should be added before implementing this phase?

If no additional input is provided, proceed using the AHIP assumptions and clearly list those assumptions.

7. Repomix Instruction

1. Generate latest Repomix from the current AHIP repository.
2. Attach or paste it with the phase prompt.
3. Ask AI to first analyze current code state.
4. Do not ask AI to blindly rewrite the project.
5. Apply changes in small validated steps.

8. AI Prompt Framework

Act as an Enterprise Healthcare Product Architect, Agentic AI Architect and Real Rails Internship Mentor.
We are building AHIP – AI Healthcare Intelligence Platform.
This is Phase 3: Knowledge Layer & Context Engineering.

This is not a chatbot.
This is not a generic RAG system.
This is a healthcare workflow intelligence platform.

Use:

- AHIP Product Bible
- AHIP Healthcare Domain Guide
- AHIP Agentic AI Guide
- AHIP Architecture Guide
- AHIP Execution Protocol
- Current Phase HTML
- Latest Repomix

First provide:

1. What already exists
2. What this phase must add
3. Healthcare concepts involved
4. Agentic AI concepts involved
5. Files/modules likely affected
6. Step-by-step implementation plan
7. Validation checklist
8. Risks and assumptions

Do not start coding until the plan is clear.

9. Deliverables

- Context Builder Service
- Claim Context Pack
- Patient Journey Context Pack
- Compliance Context Pack
- Relationship mapping
- Context validation examples

10. Validation Checklist

- Agents receive context packs instead of raw scattered data
- Context differs by agent purpose
- Relationships are visible
- Context is explainable
- No unnecessary data dumping

11. GitHub Completion Template

Phase 3 – Knowledge Layer & Context Engineering – Completed 

Completed:

- [Add completed item]
- [Add completed item]
- [Add completed item]

Healthcare Concepts Covered:

- [Add healthcare concepts]

Agentic AI Concepts Covered:

- [Add AI concepts]

Validation:

- [Add validation performed]
- [Add screenshots/logs if applicable]

AI Usage:

- Used AI for planning / debugging / documentation
- Outputs manually reviewed

Known Limitations:

- [Add limitation]

Next Phase Readiness:

- Ready / Not Ready
- Notes:

12. Handover Checklist

- Code or research output committed.
- README or phase note updated.
- Validation evidence captured.
- Known limitations listed.
- Next phase dependencies documented.
- GitHub completion post added.

13. Do Not

- Do not convert AHIP into a chatbot.
- Do not build only document Q&A.
- Do not invent unsupported healthcare rules.
- Do not make medical diagnosis or treatment recommendations.
- Do not skip auditability.

Prepared for Real Rails Agentic AI Internship Program – AHIP Phase Execution Pack.
